

ProStrikers: what we found, and how we would help

Prepared for your Marketing & Operations Assistant opening · September 16, 2026 · Public checks of prostrikers.com

IN ONE PARAGRAPH

The site is fast and has thoughtful basics like a canonical tag, link previews and a robots.txt that keeps admin and payment pages out of search. The big risk is how it is built. The site assembles itself in the browser, so the page Google first receives has no text, headings or links, and the sitemap address returns a web page instead of a sitemap. Your programmes, memberships and academy may be much harder to find than they should be.

WHAT IS ALREADY WORKING

- The site loads over HTTPS in about 0.8 seconds on our check.
- The Meta Pixel is installed.
- robots.txt keeps admin, payment and account pages out of search.
- A clear meta description, a canonical tag and link preview tags are set.

FINDINGS BY RISK

Crawlable content	High	The homepage code is about 3,300 characters with no visible text, headings or links. The page is built by JavaScript in the browser. Search engines can run JavaScript, but often later and less completely. Training programmes and membership pages may not be found or ranked.
Sitemap	High	prostrikers.com/sitemap.xml returns the site's web page instead of a sitemap, and robots.txt lists no sitemap. Search engines have no list of your programme, event and academy pages to crawl.
Old shop pages	Medium	A public site search mostly shows shop.prostrikers.com product pages, and the shop homepage returned a not found page when we checked. People searching for you may land on old shop links instead of booking or joining.
Analytics	Medium	No Google Analytics or Tag Manager is visible in the initial page code. It may load inside the app, but if it is missing you cannot see which campaigns bring bookings and memberships.
Page title	Low	The page title is just "ProStrikers". Adding the sports you train, or your location, helps people understand the result before they click.
Duplicate address	Low	Both prostrikers.com and www.prostrikers.com load without redirecting to one another. Your canonical tag helps, but a single redirect is cleaner for search engines.

WHAT WE WOULD DO FIRST

- Work with your developer on a real sitemap and a crawlable version of the key pages: programmes, memberships, academy and events.
- Redirect old shop links to the right live pages.
- Confirm GA4 and conversion events on bookings and membership sign ups.
- Run a shared content calendar for ProStrikers and Fineclicks, with Canva graphics and short form video.
- Build GoHighLevel email and SMS follow up for leads, memberships and academy campaigns.

A USEFUL WAY TO START

If you bring us on for this role, the first week includes a written sitemap and redirect list your developer can implement straight away, at no extra cost.

WHO WE ARE

Balay ni Bruno & Co. is a small operational support studio. You hire one person and get a team behind them: websites, email, social content, CRM automation and reporting that all speak with one voice.

- We run social content with weekly Reels, the GoHighLevel CRM and email, and paid ads for Freccia Construction, a custom builder in Austin, Texas.
- For JR Signing Services, a Texas notary signing agency, we run lead generation and email marketing through GoHighLevel.
- Our live client websites include woodenwoodworks.com, srivierehair.com, jrsigningservices.com and frecciagroup.com.

HOW WE CHECKED

Checked from the outside on September 16, 2026: homepage code and headings, tracking tags, robots.txt and sitemap, link preview tags, the shop subdomain, a public site search of your domain. We did not log in to anything and we have no access to your analytics or ad accounts, so anything below marked not checked is exactly that.

- The Fineclicks website and social accounts.
- Your analytics, GoHighLevel and ad accounts.
- Page speed scores, because Google's PageSpeed service did not respond during our check.
